

# DA - Graphs

<b>Define edge/arc</b>	A line connecting two vertices.
<b>Define network/weighted graph</b>	A graph with weighted edges (i.e., edges with numbers).
<b>Define order/degree of vertex</b>	The number of edges starting and finishing at the vertex.
<b>Define loop</b>	An edge starting and finishing at the same vertex.
<b>Define weight</b>	A real world value assigned to an edge (e.g., metres).
<b>Define cycle</b>	A closed path.
<b>Define Hamiltonian cycle (with example)</b>	<p>A route that...</p> <ul style="list-style-type: none"> <li>• Visits every vertex exactly once</li> <li>• Returns to the starting vertex</li> <li>• Without repeating any edges</li> </ul> <p>Example: ABCDEA for a pentagonal graph</p>
<b>When is and isn't a graph Hamiltonian-connected?</b>	<ul style="list-style-type: none"> <li>• Is when there exists a Hamiltonian cycle for every vertex.</li> <li>• Isn't when you're forced through one vertex twice or thrice.</li> </ul> <p><i>If there exists a cycle for one then there must exist a cycle for them all (as you can merely reorder the letters).</i></p>
<b>No. of Hamiltonian Cycles</b>	<ul style="list-style-type: none"> <li>• For distinct cycles in which you consider ABCA to equal ACBA, it is: <math display="block">\frac{(n - 1)!}{2}</math> </li> <li>• So for non-distinct, it is: <math display="block">(n - 1)!</math> </li> </ul> <p><i>This is because if you had 4 vertices (in ABCDA), you would have 3! ways of arranging (<u>AB</u>CD<u>A</u>). However, for any start it would be 4!.</i></p>

	<p><i>Both ABCDA and ADCBA have the same shape but opposite directions. If you treat them as equal, you'll get half as many cycles.</i></p>
<b>Define trial</b>	A route in which no edge is repeated (e.g., ABCEA).
<b>Define Eulerian trail</b>	A route which visits every edge EXACTLY ONCE.
<b>Define Eulerian cycle</b>	A trial which starts and ends at the same vertex <b>AND</b> visits every edge <b>EXACTLY ONCE</b> .
<b>TEPEV</b>	<u>T</u> rial <u>E</u> dge <u>P</u> ath <u>E</u> dge <u>V</u> ertex.
<b>Define connected graph</b>	<p>Every node is connected to the graph.</p> <p><i>Therefore, it is possible to get from any node to any other node (however not necessarily directly).</i></p>
<b>Define simple graph</b>	A graph with no loops and no repeated edges.
<b>Define complete graph (<math>K_n</math>)</b>	A graph where every vertex is connected to every other vertex directly.
<b>What is the no. of edges on a complete graph?</b>	<p>The number of edges on a complete graph is defined by:</p> $\frac{n(n-1)}{2}$ <p><i>A complete graph has <math>n-1</math> outgoing edges and <math>n</math> edges in total thus you'd be tempted to say there are <math>n(n-1)</math> edges. However, every edge is counted twice because every edge going out a vertex is going into another thus you divide by 2.</i></p>
<b>Define Eulerian graph</b>	<p>A <b>CONNECTED</b> graph with <b>ONLY EVEN VERTICES</b>.</p> <p><i>This means you can start and end at the same point (because every vertex has an edge going into and out of it).</i></p>
<b>Define semi-Eulerian graph</b>	<p>A <b>CONNECTED</b> graph with <b>EXACTLY TWO ODD VERTICES</b>.</p> <p><i>This means if you start at an odd degree vertex, you can visit every vertex yet you'll end up at the other odd degree vertex.</i></p>
<b>Define non-Eulerian graph</b>	A <b>CONNECTED</b> graph with <b>MORE THAN TWO ODD VERTICES</b> .

Define digraph	A graph with one or more directed edges.																																																										
Define bipartite graph	Two sets of vertices with edges that can only connect from one set to the other.																																																										
Define adjacency/incidence matrix	<p>A representation of the direct routes between the vertices of a graph in a matrix.</p> <p>It is routes because...</p> <div></div> <table data-bbox="997 594 1354 827"><tr><th></th><th>A</th><th>B</th><th>C</th><th>D</th></tr><tr><th>A</th><td>0</td><td>1</td><td>1</td><td>1</td></tr><tr><th>B</th><td>1</td><td>2</td><td>1</td><td>0</td></tr><tr><th>C</th><td>1</td><td>1</td><td>0</td><td>2</td></tr><tr><th>D</th><td>1</td><td>0</td><td>2</td><td>0</td></tr></table> <p>Has 2 direct routes of getting from B to B.</p> <p>Whereas...</p> <div></div> <table data-bbox="818 1205 1206 1415"><tr><th colspan="2"></th><th colspan="4">To</th></tr><tr><th colspan="2"></th><th>A</th><th>B</th><th>C</th><th>D</th></tr><tr><th rowspan="4">From</th><th>A</th><td>0</td><td>1</td><td>0</td><td>0</td></tr><tr><th>B</th><td>0</td><td>1</td><td>1</td><td>0</td></tr><tr><th>C</th><td>1</td><td>0</td><td>0</td><td>1</td></tr><tr><th>D</th><td>1</td><td>0</td><td>1</td><td>2</td></tr></table> <p>Only has 1 direct route of getting from B to B.</p>		A	B	C	D	A	0	1	1	1	B	1	2	1	0	C	1	1	0	2	D	1	0	2	0			To						A	B	C	D	From	A	0	1	0	0	B	0	1	1	0	C	1	0	0	1	D	1	0	1	2

	C	1	0	0	1																																																						
	D	1	0	1	2																																																						
Define tree and a spanning tree	<ul style="list-style-type: none"><li>• A tree is a simple graph with no cycles.</li><li>• A spanning tree is a connected tree.</li></ul>																																																										
How many edges are there in a spanning tree of n vertices and why?	<ul style="list-style-type: none"><li>• <math>n - 1</math> edges.</li><li>• For each new vertex you add to the spanning tree, you increase the original tree (of 2 vertices and 1 edge) by 1 edge.</li></ul>																																																										
Define minimum spanning tree	A spanning tree of minimum weight.																																																										

<b>Define planar graph</b>	<p>A graph that can be (re)drawn so that none of its arcs cross.</p> <p><i>This can be useful for insulated wires on microchips.</i></p>
<b>Define isomorphic graph</b>	A graph that has the same number of vertices connected in the same way as another.
<b>Define complement of a graph</b>	A graph of all missing edges required to make another graph complete.
<b>Define subgraph</b>	Part of a graph.
<b>Define subdivision</b>	<p>Where you split an edge into two edges by adding an extra vertex.</p> 
<b>What is Euler's Formula and when does it hold true?</b>	<p>Holds true for any <b>CONNECTED PLANAR</b> graph (e.g., many 3D solids).</p> $V + F - E = 2$ <p><i>This can be remembered by using the vertices, faces, and edge of a cube.</i></p>
<b>What is Kuratowski's Theorem?</b>	A graph is planar if and only if it does not contain a subgraph that is a subdivision of $K_5$ or of $K_{3,3}$ .
<b>What is the triangle inequality?</b>	<div> <p>The triangle inequality states that the sum of the lengths of any two sides of a triangle cannot be less than the length of the third side.</p> <p><math>AB + BC \geq AC</math></p> </div> <div>Key point</div>
